

Reverse Phone API

From just a phone number, get an owner's current name, address, demographics, phone details, household members, and relatives.

Features

Powerful identification

Provides the full registered names behind the number.

Address information

Shows the current address corroborated from 30+ years of address history and details on residence type, deliverability, and more.

Demographics

Includes gender, age-range, and more of registered phone owner and address residents.

Advanced phone attributes

Includes line type, carrier, pre-paid status, and more.

Associated people and relatives

Gives list of related people and/or household members.

Alternative phone numbers

Provides additional landlines associated with the phone subscriber.

Commercial flag

Shows if the phone number is associated with a business.

Link start and end dates

Gives the date when the phone was first linked to the person and address. If historical, the link end date is also provided.

Business Benefits

Get your priorities straight

Prioritize queues by ROI potential.

Enrich customer records

Automatically enhance customer demographics and contact info in your CRM.

Dropped call? Don't worry

Recapture dropped calls with data behind the number.

Simple Access

Enterprise-grade API

Speed, simplicity, and scale via our RESTful API.

Partners

Easily access our data via key partners including Twilio and FICO

Reverse Phone API Attributes

Full name of owner(s) and parsed names(s)

Provides the name of the person(s) or business(es) who are registered to the phone number in full string and parsed formats.

Valid or invalid

Indicates whether the phone number is a real phone number with a valid area code.

Line type

Indicates whether the phone is a landline, mobile, fixed or non-fixed VoIP, premium, toll-free, or voicemail-only service.

Carrier

Indicates the company providing service to the associated number, including hard-to-identify carriers such as Boost, Metro PCS and TracFone.

Prepaid status

Indicates whether a mobile number is part of a prepaid service plan.

Current and historical address(es)

Includes the full current and historical address(es) associated with the number.

Is commercial

If true, phone number is associated to a business. Possible values are true, false, null.

Country code

International country code (Spec: ITU-T E.164). Example: "1" for USA & Canada.

Unique identifier

Provides a unique identifier for each element for easy velocity tracking.

Link start and end dates

Gives the date when the phone was first linked to the person and address. If historical, the link end date is also provided.
